

CS162 Operating Systems and Systems Programming Lecture 2

Four Fundamental OS Concepts

January 23th, 2020
Prof. John Kubiatowicz
<http://cs162.eecs.Berkeley.edu>

Review: What is an Operating System?

- Referee
 - Manage sharing of resources, Protection, Isolation
 - » Resource allocation, isolation, communication

- Illusionist
 - Provide clean, easy to use abstractions of physical resources
 - » Infinite memory, dedicated machine
 - » Higher level objects: files, users, messages
 - » Masking limitations, virtualization

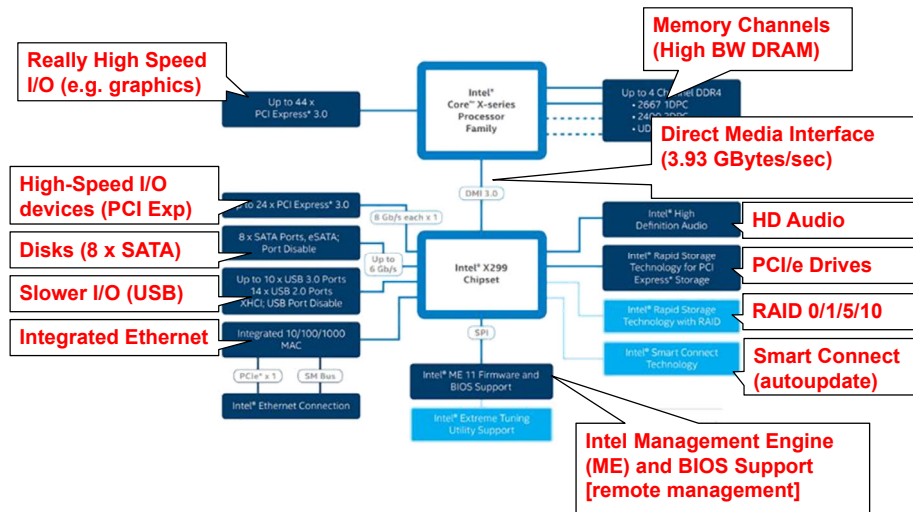

- Glue
 - Common services
 - » Storage, Window system, Networking
 - » Sharing, Authorization
 - » Look and feel

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.2

Recall: HW Functionality \Rightarrow great complexity!

Intel Skylake-X I/O Configuration

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.3

Recall: Increasing Software Complexity

Millions of Lines of Code

(source <https://informationisbeautiful.net/visualizations/million-lines-of-code/>)

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.4

Recall: How do we tame complexity?

- Every piece of computer hardware different
 - Different CPU
 - » Pentium, PowerPC, ColdFire, ARM, MIPS
 - Different amounts of memory, disk, ...
 - Different types of devices
 - » Mice, Keyboards, Sensors, Cameras, Fingerprint readers
 - Different networking environment
 - » Cable, DSL, Wireless, Firewalls,...
- Questions:
 - Does the programmer need to write a single program that performs many independent activities?
 - Does every program have to be altered for every piece of hardware?
 - Does a faulty program crash everything?
 - Does every program have access to all hardware?

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.5

OS Abstracts underlying hardware

- Processor => Thread
- Memory => Address Space
- Disks, SSDs, ... => Files
- Networks => Sockets
- Machines => Processes

- OS Goals:
 - Remove software/hardware quirks (*fight complexity*)
 - Optimize for convenience, utilization, reliability, ... (*help the programmer*)
- For any OS area (e.g. file systems, virtual memory, networking, scheduling):
 - What hardware interface to handle? (physical reality)
 - What's software interface to provide? (nicer abstraction)

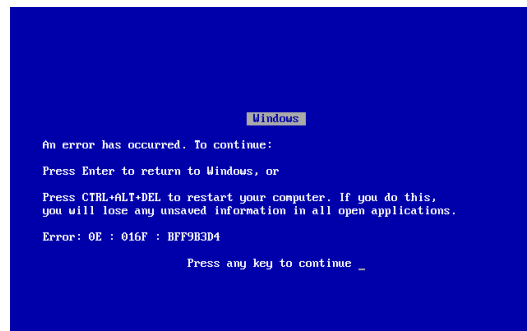

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.6

OS Goal: Protecting Processes & The Kernel

- Run multiple applications and:
 - Keep them from interfering with or crashing the operating system
 - Keep them from interfering with or crashing each other

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.7

Virtual Machines

- Virtualize every detail of a hardware configuration so perfectly that you can run an operating system (and many applications) on top of it.
 - VMWare Fusion, Virtual box, Parallels Desktop, Xen, Vagrant
- Provides isolation
- Complete insulation from change
- The norm in the Cloud (server consolidation)
- Long history (60's in IBM OS development)
- All our work will take place INSIDE a VM
 - Vagrant (new image just for you)

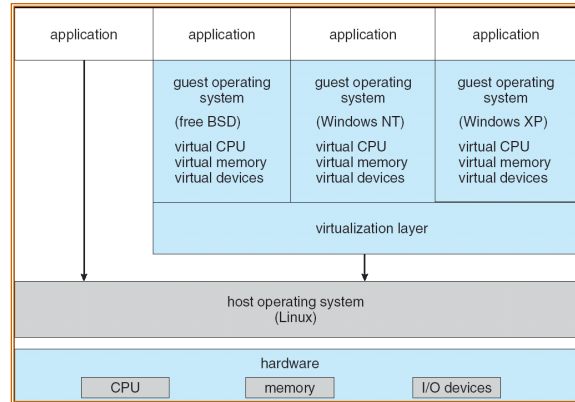

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.8

System Virtual Machines: Layers of OSs

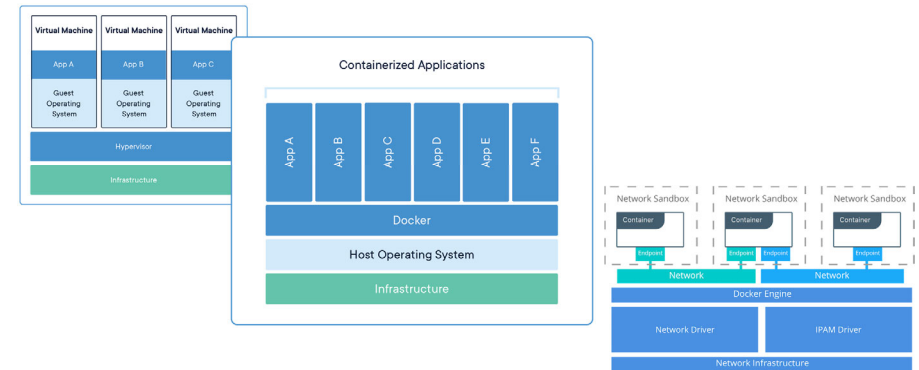

- Useful for OS development
 - When OS crashes, restricted to one VM
 - Can aid testing/running programs on other OSs
- Use for deployment
 - Running different OSes at the same time

1/23/2020

Lec 2.9

Containers *virtualize the OS*

- Roots in OS developments to provide protected systems abstraction, not just application abstraction
 - User-level file system (route syscalls to user process)
 - Cgroups – predictable, bounded resources (CPU, Mem, BW)

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.10

Basic tool: Dual Mode Operation

- Hardware provides at least two modes:
 - Kernel Mode (or "supervisor" / "protected" mode)
 - User Mode
- Certain operations are **prohibited** when running in user mode
 - Changing the page table pointer
- Carefully controlled transitions between user mode and kernel mode
 - System calls, interrupts, exceptions

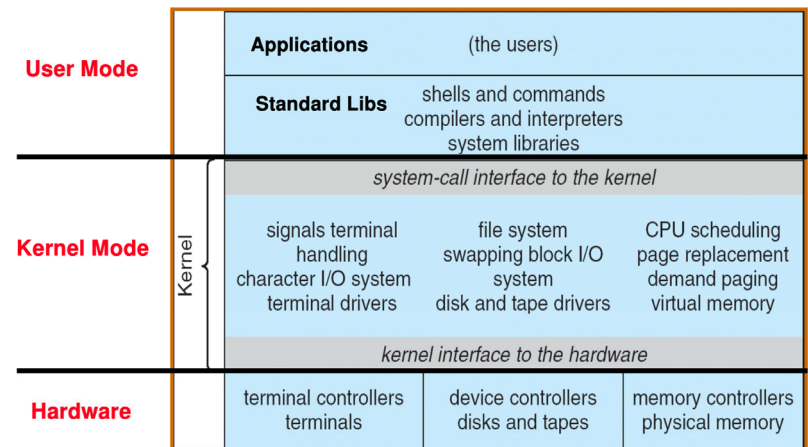

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.11

UNIX OS Structure

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.12

Today: Four Fundamental OS Concepts

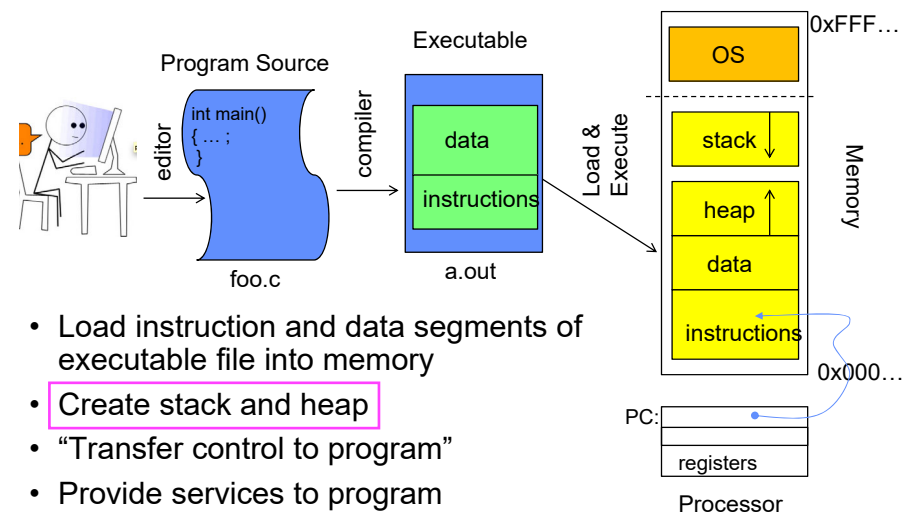

- **Thread: Execution Context**
 - Fully describes program state
 - Program Counter, Registers, Execution Flags, Stack
- **Address space (with or w/o translation)**
 - Set of memory addresses accessible to program (for read or write)
 - May be distinct from memory space of the physical machine (in which case programs operate in a virtual address space)
- **Process: an instance of a running program**
 - Protected Address Space + One or more Threads
- **Dual mode operation / Protection**
 - Only the “system” has the ability to access certain resources
 - Combined with translation, isolates programs from each other and the OS from programs

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.13

OS Bottom Line: Run Programs

- Load instruction and data segments of executable file into memory
- **Create stack and heap**
- “Transfer control to program”
- Provide services to program
- While protecting OS and program

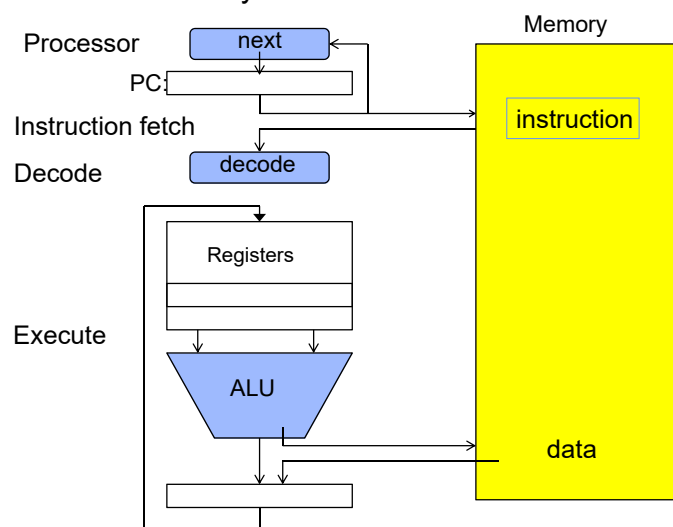

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.14

Recall (61C): Instruction Fetch/Decode/Execute

The instruction cycle

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.15

First OS Concept: Thread of Control

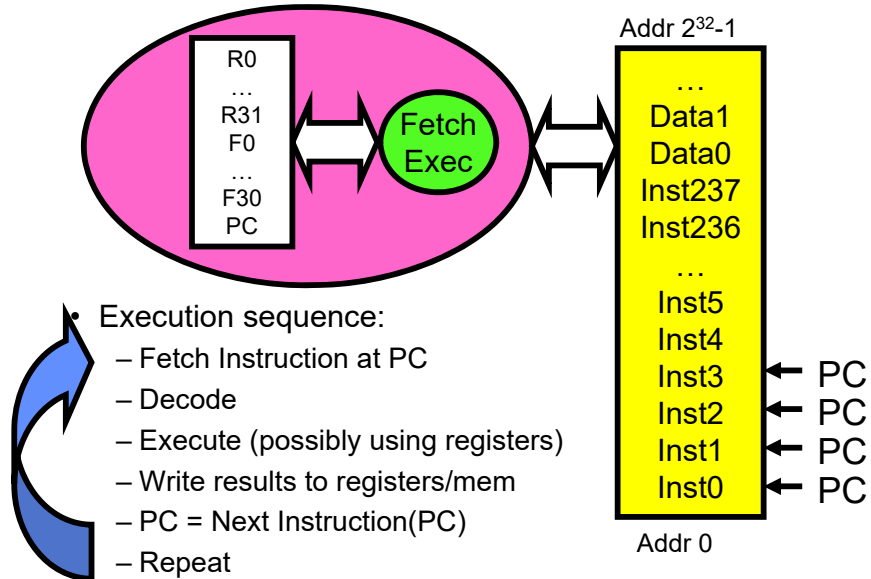

- **Thread: Single unique execution context**
 - Program Counter, Registers, Execution Flags, Stack, Memory State
- A thread is **executing** on a processor (core) when it is **resident** in the processor registers
- Resident means: Registers hold the root state (context) of the thread:
 - Including program counter (PC) register & currently executing instruction
 - » PC points at next instruction **in memory**
 - » Instructions stored **in memory**
 - Including intermediate values for ongoing computations
 - » Can include actual values (like integers) or pointers to values **in memory**
 - Stack pointer holds the address of the top of stack (which is **in memory**)
 - **The rest is “in memory”**
- A thread is **suspended** (not **executing**) when its state **is not** loaded (resident) into the processor
 - Processor state pointing at some other thread
 - Program counter register **is not** pointing at next instruction from this thread
 - Often: a copy of the last value for each register stored in memory

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.16

Recall (61C): What happens during program execution?

1/23/2020

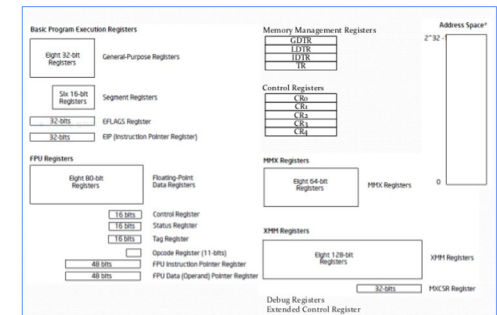

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.17

Registers: RISC-V \Rightarrow x86

Register	AH Name	Description	Saver
x0	zero	Hard-wired zero	—
x1	ra	Return address	Caller
x2	sp	Stack pointer	Caller
x3	gp	Global pointer	—
x4	tp	Thread pointer	Caller
x5	t0	Temporary/alternate link register	Caller
x6-7	t1-2	Temporaries	Caller
x8	s0/fp	Saved register/frame pointer	Caller
x9	s1	Saved register	Caller
x10-11	s0-1	Function arguments/return values	Caller
x12-17	a2-7	Function arguments	Caller
x18-27	s2-11	Saved registers	Caller
x28-31	t3-6	Temporaries	Caller

Load/Store Arch (RISC-V)
with software conventions

Complex mem-mem arch (x86) with
specialized registers and "segments"

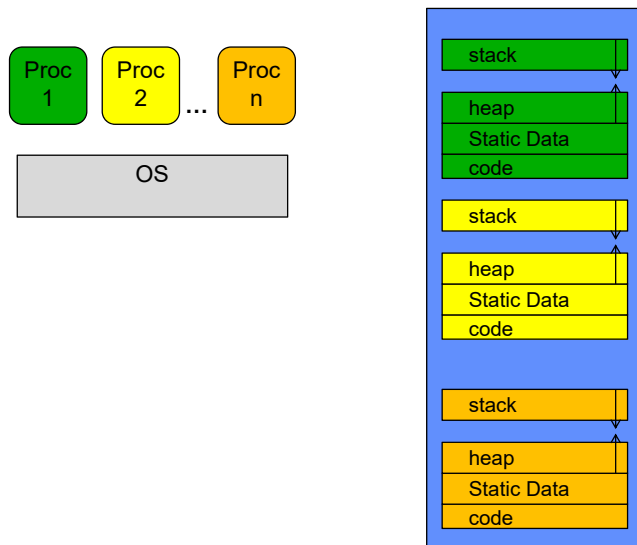

- cs61C does RISC-V. Will need to learn x86...
- Section next week

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.18

Multiprogramming - Multiple Threads of Control

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.19

Illusion of Multiple Processors

- Assume a single processor (core). How do we provide the illusion of multiple processors?
 - Multiplex in time!
- Threads are *virtual cores*
- Contents of virtual core (thread):
 - Program counter, stack pointer
 - Registers
- Where is "it" (the thread)?
 - On the real (physical) core, or
 - Saved in chunk of memory – called the *Thread Control Block (TCB)*

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.20

Illusion of Multiple Processors (Continued)

- Consider:
 - At T1: vCPU1 on real core, vCPU2 in memory
 - At T2: vCPU2 on real core, vCPU1 in memory
- What happened?
 - OS Ran [how?]
 - Saved PC, SP, ... in vCPU1's thread control block (memory)
 - Loaded PC, SP, ... from vCPU2's TCB, jumped to PC
- What triggered this switch?
 - Timer, voluntary yield, I/O, other things we will discuss

OS object representing a thread?

- Traditional term: Thread Control Block (TCB)
 - Holds contents of registers when thread is not running
 - What other information?
-
- PINTOS? – read `thread.h` and `thread.c`

Administrivia: Getting started

- Start homework 0 immediately ⇒ **Due next Friday (1/31)!**
 - cs162-xx account, Github account, registration survey
 - Vagrant and VirtualBox – VM environment for the course
 - » Consistent, managed environment on your machine
 - Get familiar with all the cs162 tools, submit to autograder via git
 - Homework slip days: **You have 3 slip days**
- Should go to section tomorrow!
- Monday is an optional REVIEW session for C
 - In 306 Soda: Monday 1/27 @6-8pm
 - Won't be webcast, no released slides!
- Friday (1/31) is drop day!
 - Very hard to drop afterwards...
 - Please drop sooner if you are going to anyway ⇒ Let someone else in!

Administrivia (Con't)

- Midterm conflicts:
 - There are a couple of people with midterm conflicts – we are still figuring out what to do (if anything)
- Kubiatowicz Office Hours:
 - 1pm-2pm, Monday/Thursday
 - May change as need arises (still have a bit of fluidity here)
- Three Free Online Textbooks:
 - Click on “Resources” link for a list of “Online Textbooks”
 - Can read O'Reilly books for free as long as on campus or VPN
 - » One book on Git, two books on C
- Webcast: <https://CalCentral.Berkeley.edu/> (CalNet sign in)
 - Webcast is ***NOT*** a replacement for coming to class!

CS 162 Collaboration Policy

Explaining a concept to someone in another group
 Discussing algorithms/testing strategies with other groups
 Helping debug someone else's code (in another group)
 Searching online for generic algorithms (e.g., hash table)

Sharing code or test cases with another group
 Copying OR reading another group's code or test cases
 Copying OR reading online code or test cases from prior years

We compare all project submissions against prior year submissions and online solutions and will take actions (described on the course overview page) against offenders

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.25

Second OS Concept: Address Space

- Address space \Rightarrow the set of accessible addresses + state associated with them:

- For a 32-bit processor there are $2^{32} = 4$ billion addresses

- What happens when you read or write to an address?

- Perhaps acts like regular memory
- Perhaps ignores writes
- Perhaps causes I/O operation
 - » (Memory-mapped I/O)
- Perhaps causes exception (fault)
- Communicates with another program
-

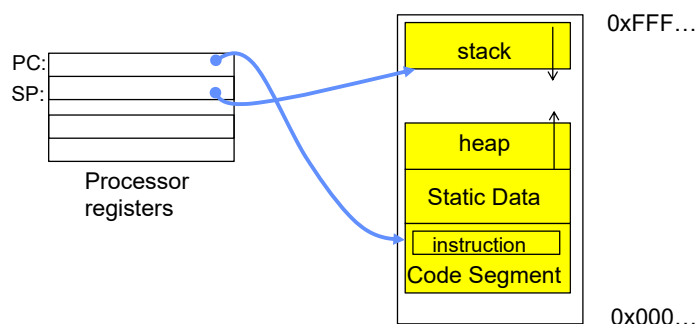

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.26

Address Space: In a Picture

- What's in the code segment? Static data segment?
 - What's in the Stack Segment?
 - How is it allocated? How big is it?
 - What's in the Heap Segment?
 - How is it allocated? How big is it?
- global variables

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.27

Previous discussion of threads: Very Simple Multiprogramming

- All vCPU's share non-CPU resources
 - Memory, I/O Devices
- Each thread can read/write memory
 - Perhaps data of others
 - can overwrite OS ?
- Unusable?
- This approach is used in
 - Very early days of computing
 - Embedded applications
 - MacOS 1-9/Windows 3.1 (switch only with voluntary yield)
 - Windows 95-ME (switch with yield or timer)
- However it is risky...

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.28

Simple Multiplexing has no Protection

- Operating System must protect itself from user programs
 - Reliability: compromising the operating system generally causes it to crash
 - Security: limit the scope of what threads can do
 - Privacy: limit each thread to the data it is permitted to access
 - Fairness: each thread should be limited to its appropriate share of system resources (CPU time, memory, I/O, etc)
- OS must protect User programs from one another
 - Prevent threads owned by one user from impacting threads owned by another user
 - Example: prevent one user from stealing secret information from another user

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.29

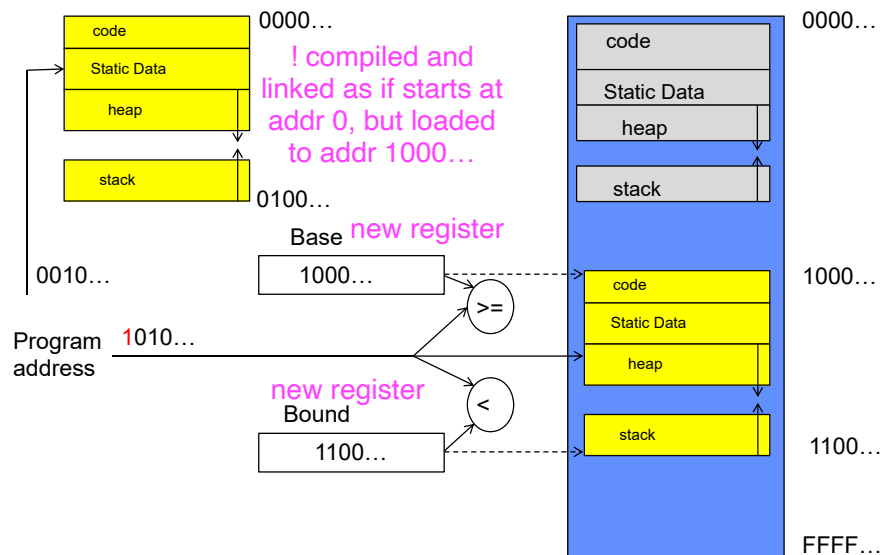

What can the hardware do to help the OS protect itself from programs???

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.30

Simple Protection: Base and Bound (B&B)

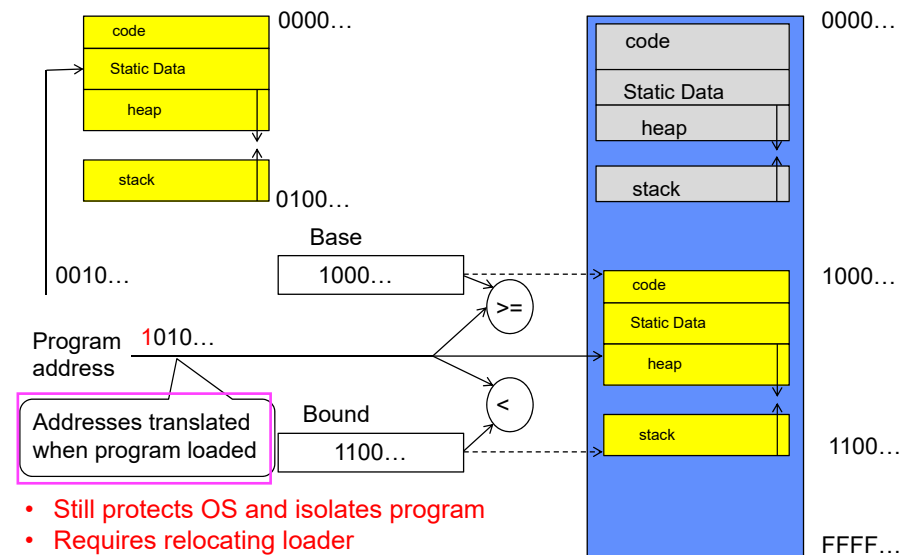

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.31

Simple Protection: Base and Bound (B&B)

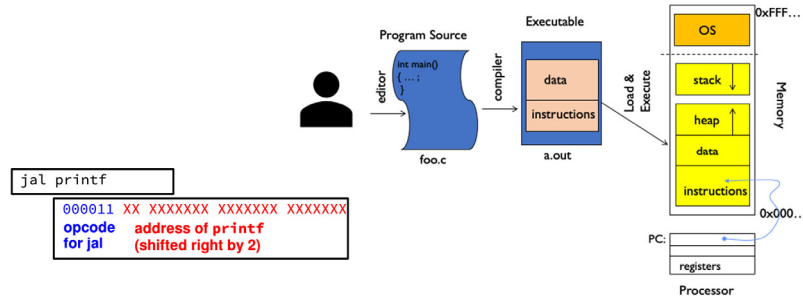

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.32

- Still protects OS and isolates program
- Requires relocating loader
- No addition on address path

61C Review: Relocation

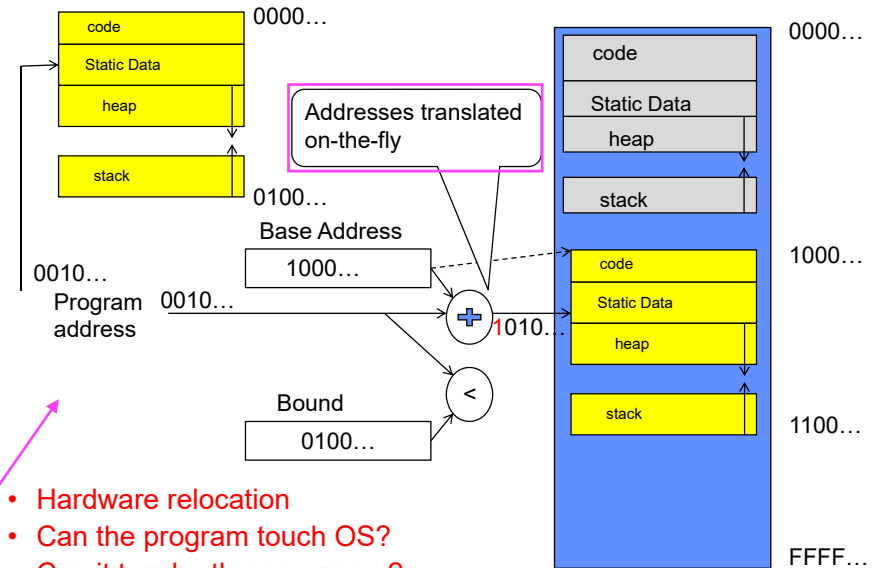

- Compiled .obj file linked together in an .exe
- All address in the .exe are as if it were loaded at memory address 00000000
- File contains a list of all the addresses that need to be adjusted when it is “relocated” to somewhere else.

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.33

A different Option Simple address translation with Base and Bound

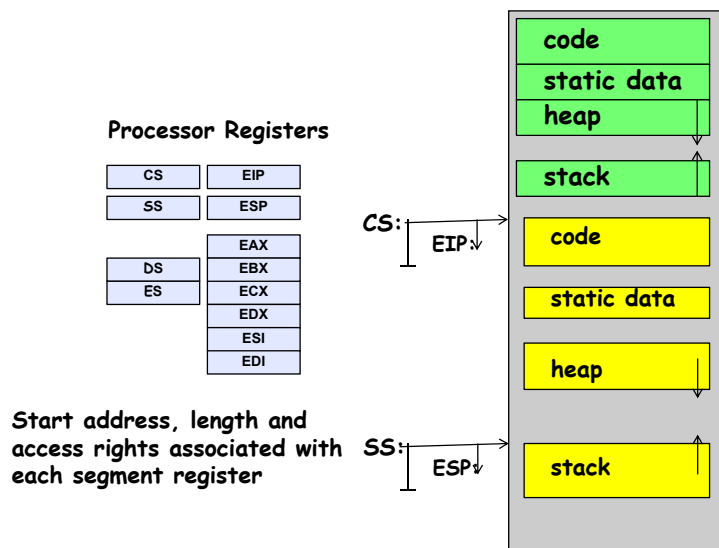

- Hardware relocation
- Can the program touch OS?
- Can it touch other programs?

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.34

x86 – segments and stacks

one way to think of segments in x86 is literally like this version of B&B with hardware relocation. There's no just 1 B&B, there's a lot of them.

Another idea: Address Space Translation

- Program operates in an address space that is distinct from the physical memory space of the machine

is a general version where the processor has general virtual addresses and we translate to physical addresses.

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.35

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.36

Paged Virtual Address Space

- What if we break the entire virtual address space into equal size chunks (i.e., pages) have a base for each? *4k is a good size*
- Treat memory as page size frames and put any page into any frame ...

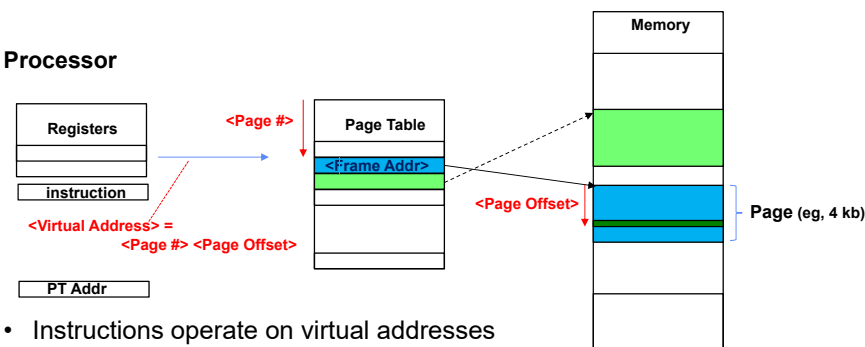

• Another cs61C review...

A processor has virtual address: $\langle \text{Page \#} \rangle \langle \text{Page offset} \rangle$.
Just suffice it to say that this gets rid of that problem that people were worried about — how do I pick the right size.

What we've done is we took the process's virtual address and we divide it up into bunch of equal-size pages that make management really easy. We don't have the external fragmentation issue.

Paged Virtual Address

Processor

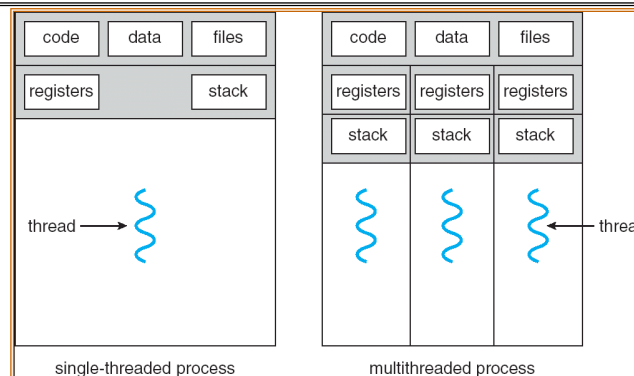

- Instructions operate on virtual addresses
 - Instruction address, load/store data address
- Translated to a physical address (or Page Fault) through a Page Table by the hardware
- Any Page of address space can be in any (page sized) frame in memory
 - Or not-present (access generates a page fault)
- Special register holds page table base address (of the process)

Third OS Concept: Process

- Process: execution environment with Restricted Rights**
 - (Protected) Address Space with One or More Threads
 - Owns memory (address space)
 - Owns file descriptors, file system context, ...
 - Encapsulate one or more threads sharing process resources
- Application program executes as a process
 - Complex applications can fork/exec child processes [later!]
- Why processes?
 - Protected from each other!
 - OS Protected from them
 - Processes provides memory protection
 - Threads more efficient than processes for parallelism (later)
- Fundamental tradeoff between protection and efficiency
 - Communication easier *within* a process
 - Communication harder *between* processes

protected environment with multiple threads

Single and Multithreaded Processes

- Threads encapsulate **concurrency**: “Active” component
- Address spaces encapsulate **protection**: “Passive” part
 - Keeps buggy program from trashing the system
- Why have multiple threads per address space?

Kernel code/data in process Virtual Address Space?

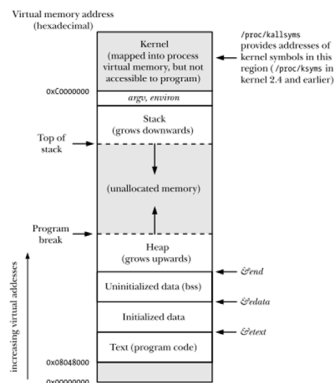

Figure 6-1: Typical memory layout of a process on Linux/x86-32

- Unix: Kernel space is mapped in high - but inaccessible to user processes

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.41

Fourth OS Concept: Dual Mode Operation

- **Hardware** provides at least two modes:
 - “Kernel” mode (or “supervisor” or “protected”)
 - “User” mode: Normal programs executed
- What is needed in the hardware to support “dual mode” operation?
 - A bit of state (user/system mode bit)
 - Certain operations / actions only permitted in system/kernel mode
 - » In user mode they fail or trap
 - User → Kernel transition *sets* system mode AND saves the user PC
 - » Operating system code carefully puts aside user state then performs the necessary operations
 - Kernel → User transition *clears* system mode AND restores appropriate user PC
 - » return-from-interrupt

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.42

User/Kernel (Privileged) Mode

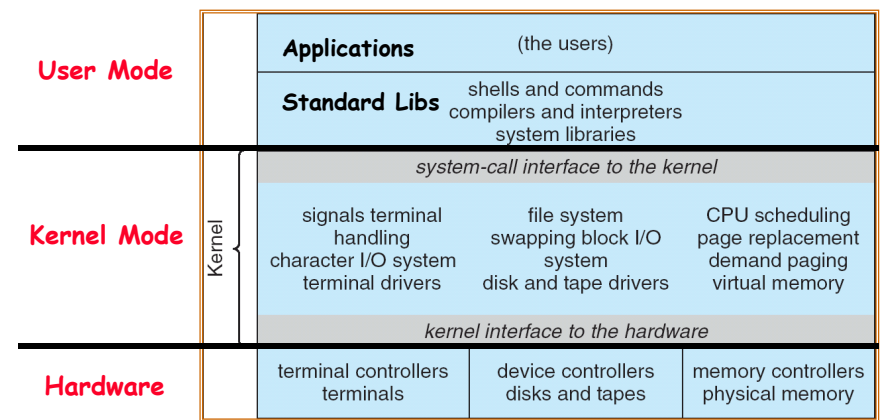

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.43

For example: UNIX System Structure

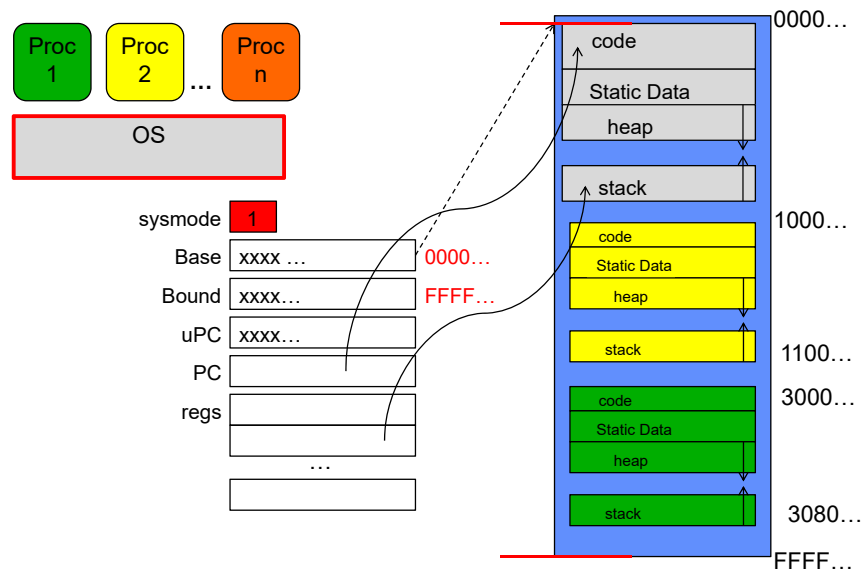

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.44

Tying it together: Simple B&B: OS loads process

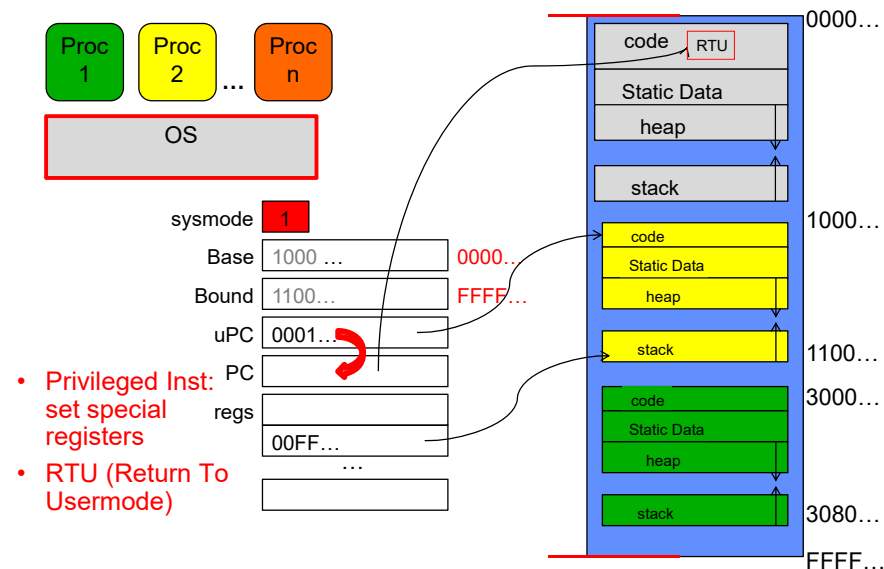

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.45

Simple B&B: OS gets ready to execute process

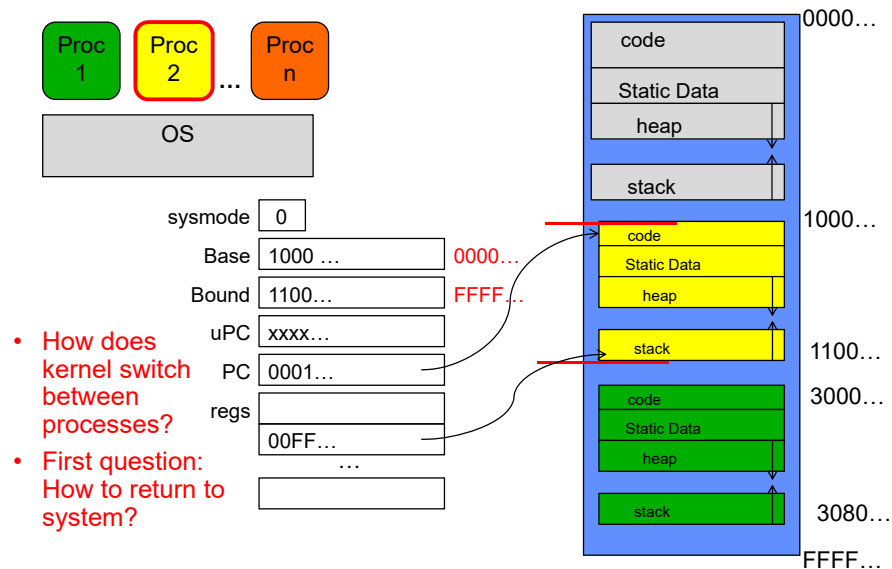

- Privileged Inst: set special registers
- RTU (Return To Usermode)

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.46

Simple B&B: User Code Running

- How does kernel switch between processes?
- First question: How to return to system?

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.47

3 types of Mode Transfer

- Syscall
 - Process requests a system service, e.g., exit
 - Like a function call, but "outside" the process
 - Does not have the address of the system function to call
 - Like a Remote Procedure Call (RPC) – for later
 - Marshall the syscall id and args in registers and exec syscall
- Interrupt
 - External asynchronous event triggers context switch
 - e.g., Timer, I/O device
 - Independent of user process
- Trap or Exception
 - Internal synchronous event in process triggers context switch
 - e.g., Protection violation (segmentation fault), Divide by zero, ...
- All 3 are an UNPROGRAMMED CONTROL TRANSFER
 - Where does it go?

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.48

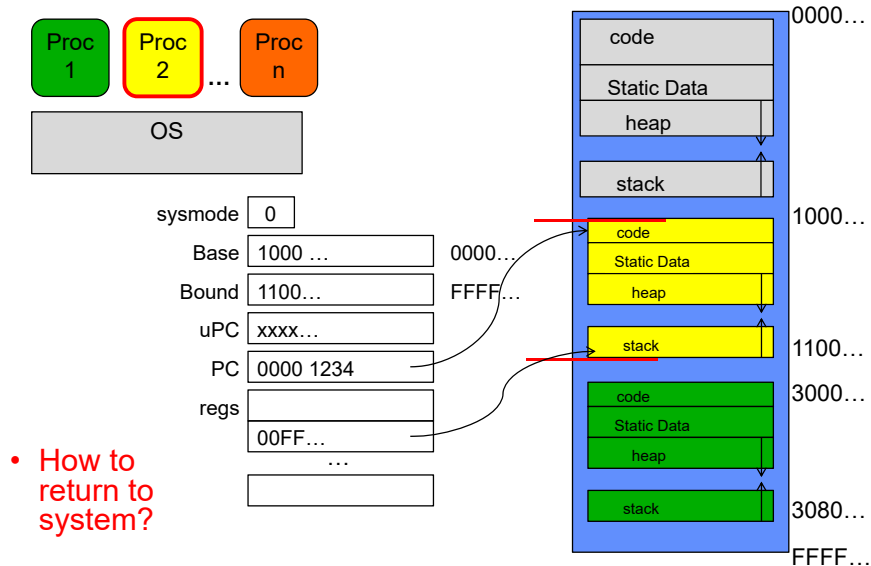

How do we get the system target address of the “unprogrammed control transfer?”

Interrupt Vector

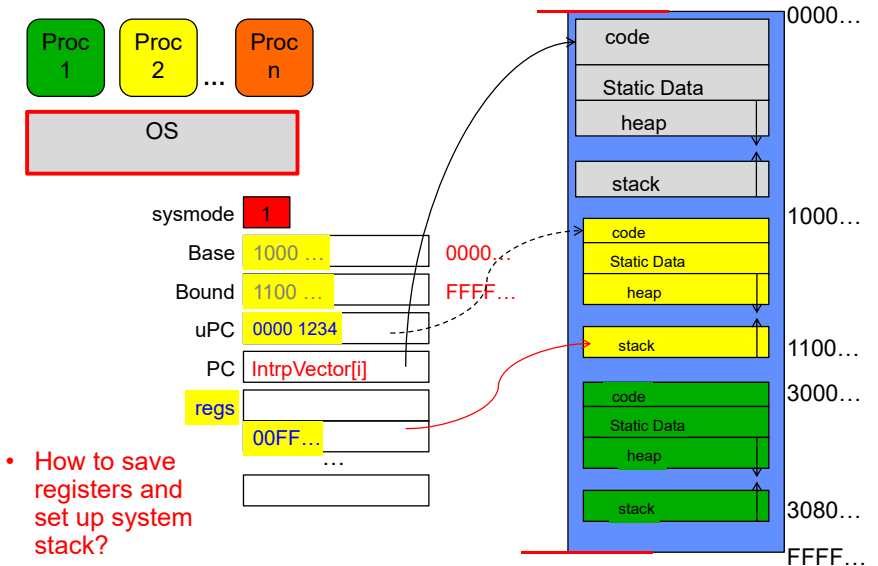

- Where else do you see this dispatch pattern?

Simple B&B: User => Kernel

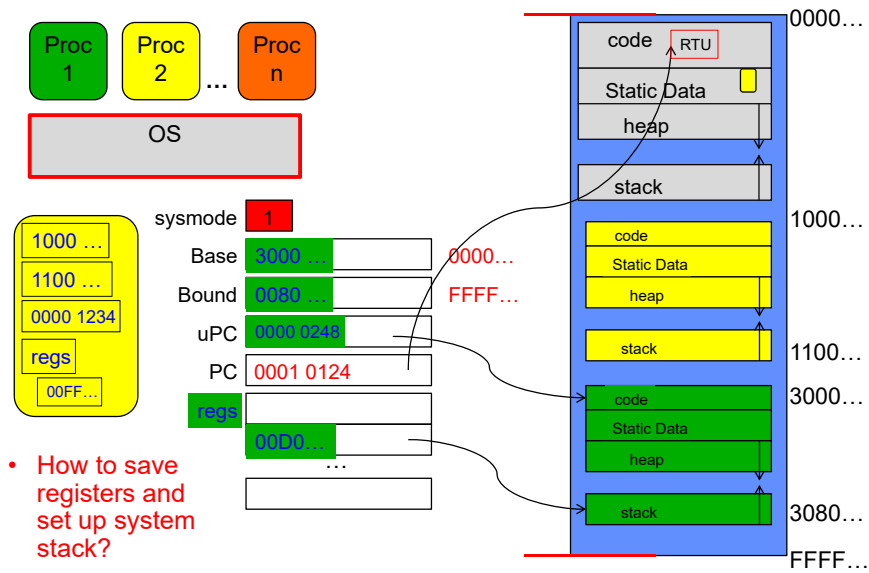

- How to return to system?

Simple B&B: Interrupt

- How to save registers and set up system stack?

Simple B&B: Switch User Process

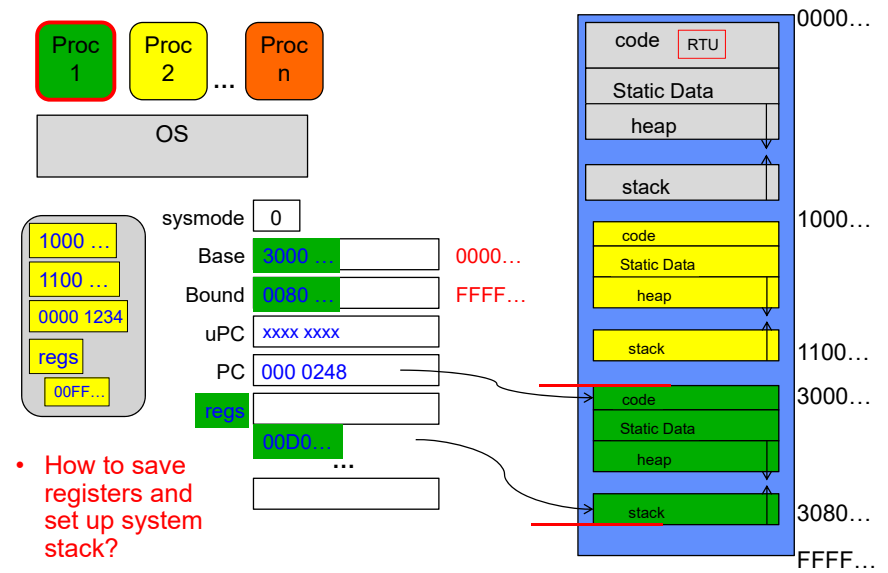

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.53

Simple B&B: “resume”

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.54

Running Many Programs ???

- We have the basic mechanism to
 - switch between user processes and the kernel,
 - the kernel can switch among user processes,
 - Protect OS from user processes and processes from each other
- Questions ???
- How do we decide which user process to run?
- How do we represent user processes in the OS?
- How do we pack up the process and set it aside?
- How do we get a stack and heap for the kernel?
- Aren't we wasting a lot of memory?
- ...

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.55

Process Control Block

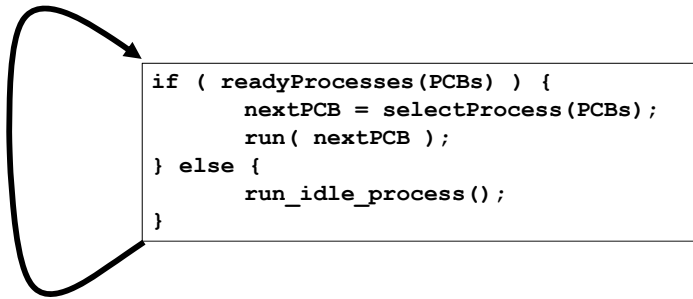

- Kernel represents each process as a process control block (PCB)
 - Status (running, ready, blocked, ...)
 - Register state (when not ready)
 - Process ID (PID), User, Executable, Priority, ...
 - Execution time, ...
 - Memory space, translation, ...
- Kernel Scheduler maintains a data structure containing the PCBs
- Scheduling algorithm selects the next one to run

1/23/2020

Kubiatowicz CS162 ©UCB Spring 2020

Lec 2.56

Scheduler

Conclusion: Four Fundamental OS Concepts

- **Thread: Execution Context**
 - Fully describes program state
 - Program Counter, Registers, Execution Flags, Stack
- **Address space (with or w/o translation)**
 - Set of memory addresses accessible to program (for read or write)
 - May be distinct from memory space of the physical machine (in which case programs operate in a virtual address space)
- **Process: an instance of a running program**
 - Protected Address Space + One or more Threads
- **Dual mode operation / Protection**
 - Only the “system” has the ability to access certain resources
 - Combined with translation, isolates programs from each other and the OS from programs
